FOOD DELIVERY AGGREGATOR

SRS DOCUMENT + UML DIAGRAMS

Software Engineering Assignment

1. Introduction

Food Delivery Aggregator connects customers, restaurants and delivery partners through one platform.

Customers can discover restaurants, compare menus, place orders, pay online and track delivery.

Restaurants manage menus and incoming orders, while delivery partners manage pickup and delivery.

Administrators monitor users, restaurants, orders, payments, complaints and reports.

2. SRS – Purpose & Scope

Purpose: specify the functional and non-functional requirements of the system.

Scope: customer application, restaurant portal, delivery partner application and admin portal.

Core services: authentication, restaurant search, menu, cart, ordering, payment, tracking, reviews and notifications.

System objective: provide a reliable, secure and convenient end-to-end food ordering service.

3. Functional Requirements

Customer: register/login, manage profile and addresses, search restaurants, browse menu, cart, checkout, payment, tracking and ratings.

Restaurant: manage restaurant details and menu, accept/reject orders, update preparation status and view sales.

Delivery Partner: receive assignments, accept delivery, update pickup/location/delivery status and view earnings.

Admin: manage accounts, restaurants, delivery partners, orders, complaints and system reports.

4. Non-Functional Requirements

Performance – fast response for normal user operations and order updates.

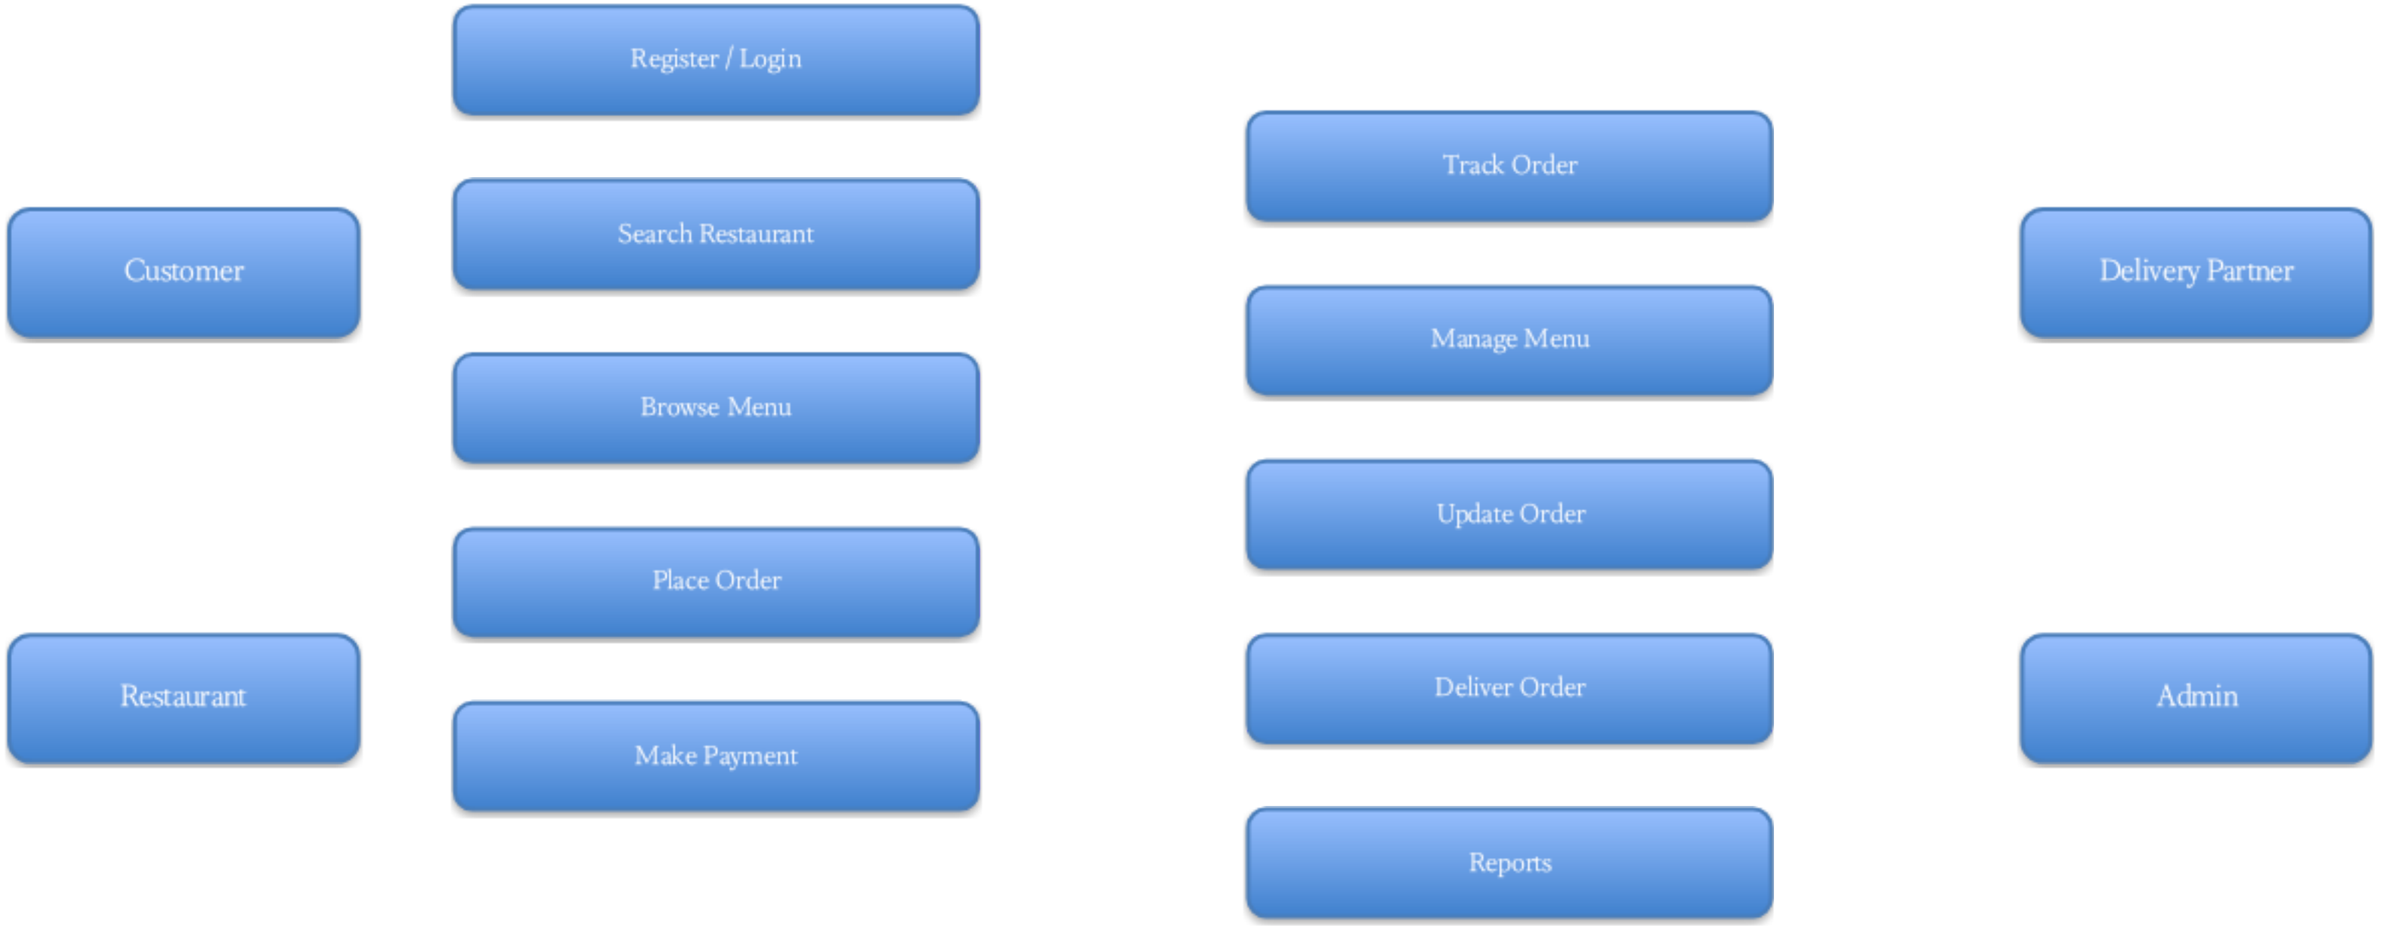

Security – authentication, role-based access, secure communication and protected payment processing.

Availability – reliable service with error handling and recovery.

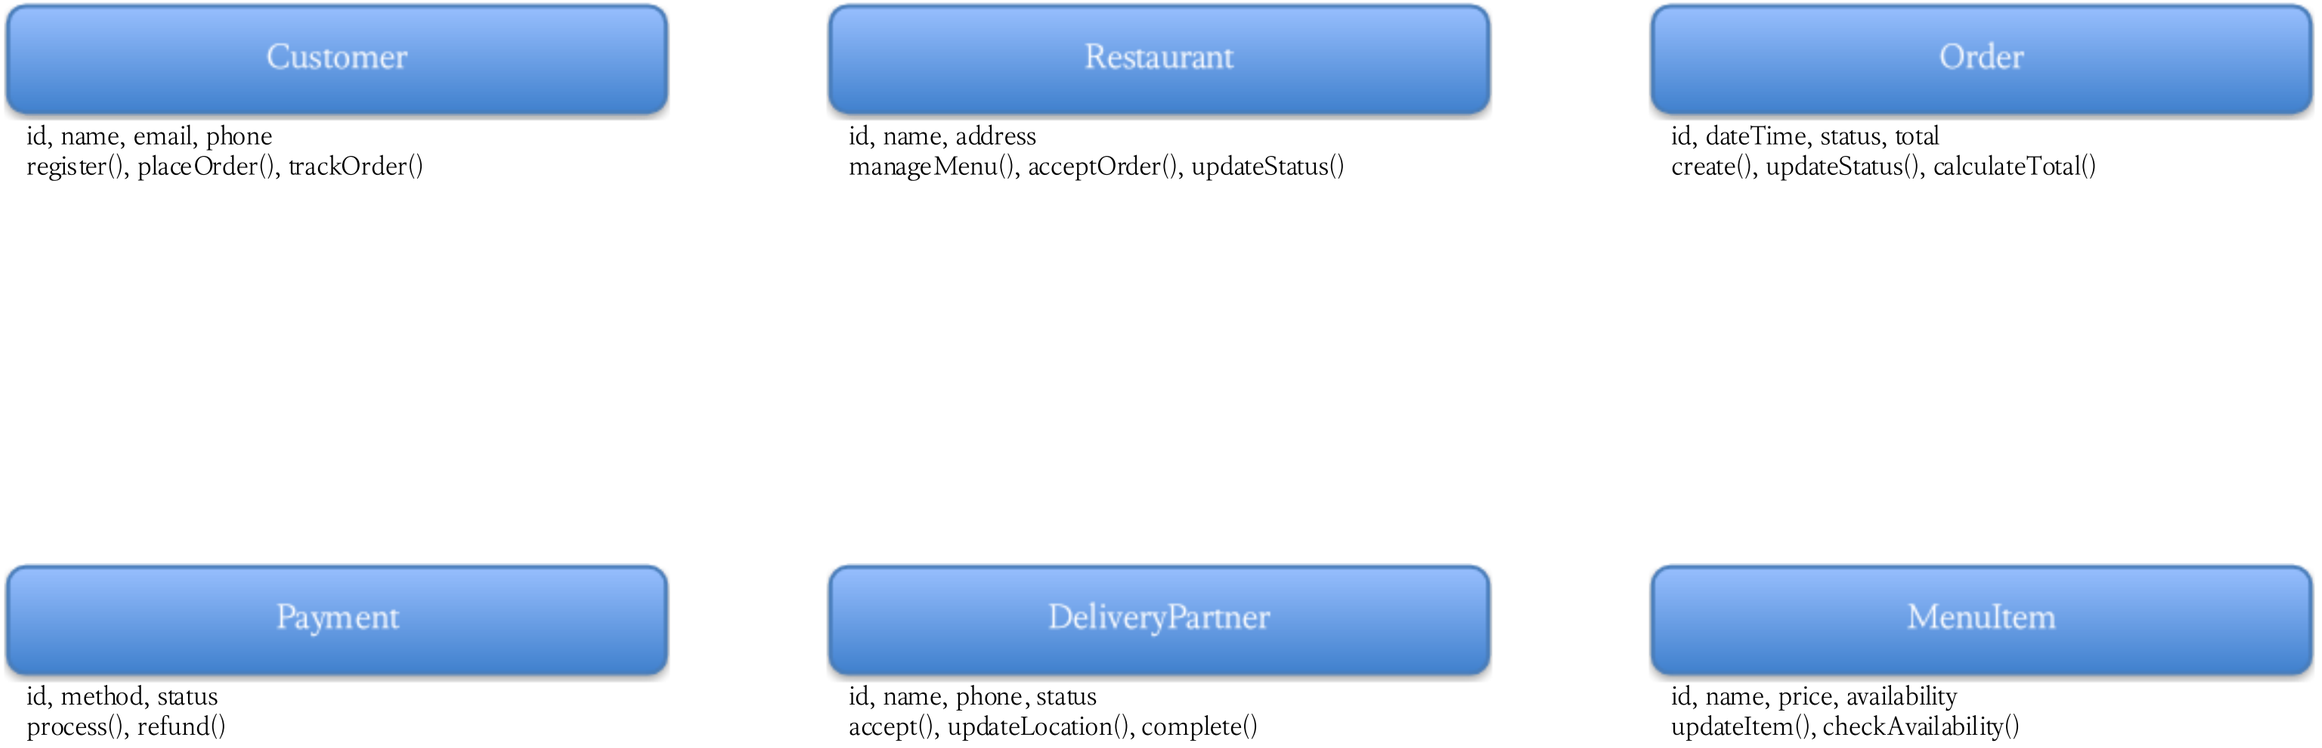

Usability – simple, responsive interface with clear order status.

Scalability & Maintainability – modular services, logging, monitoring and easy upgrades.

5. UML – Use Case Diagram

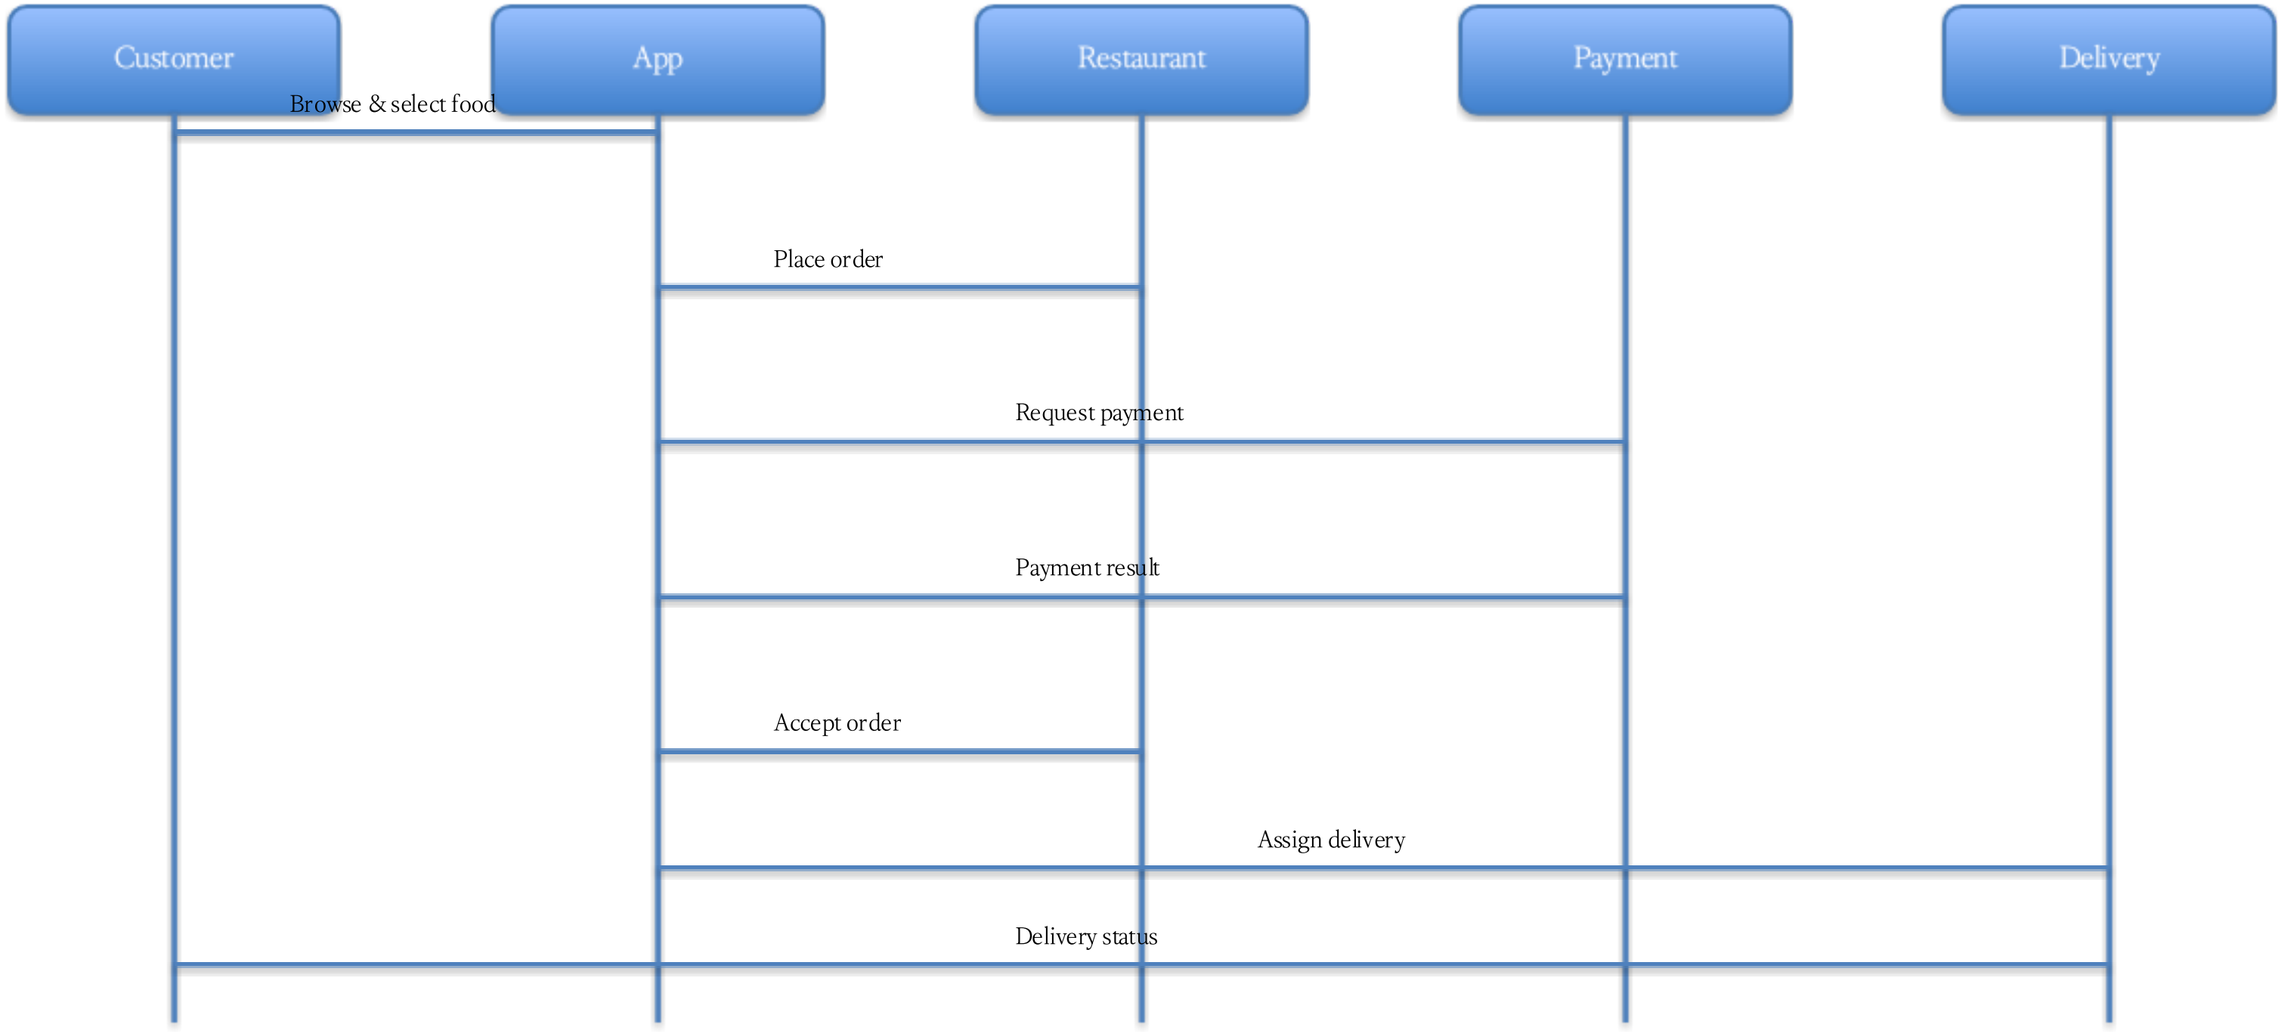

6. UML – Class Diagram

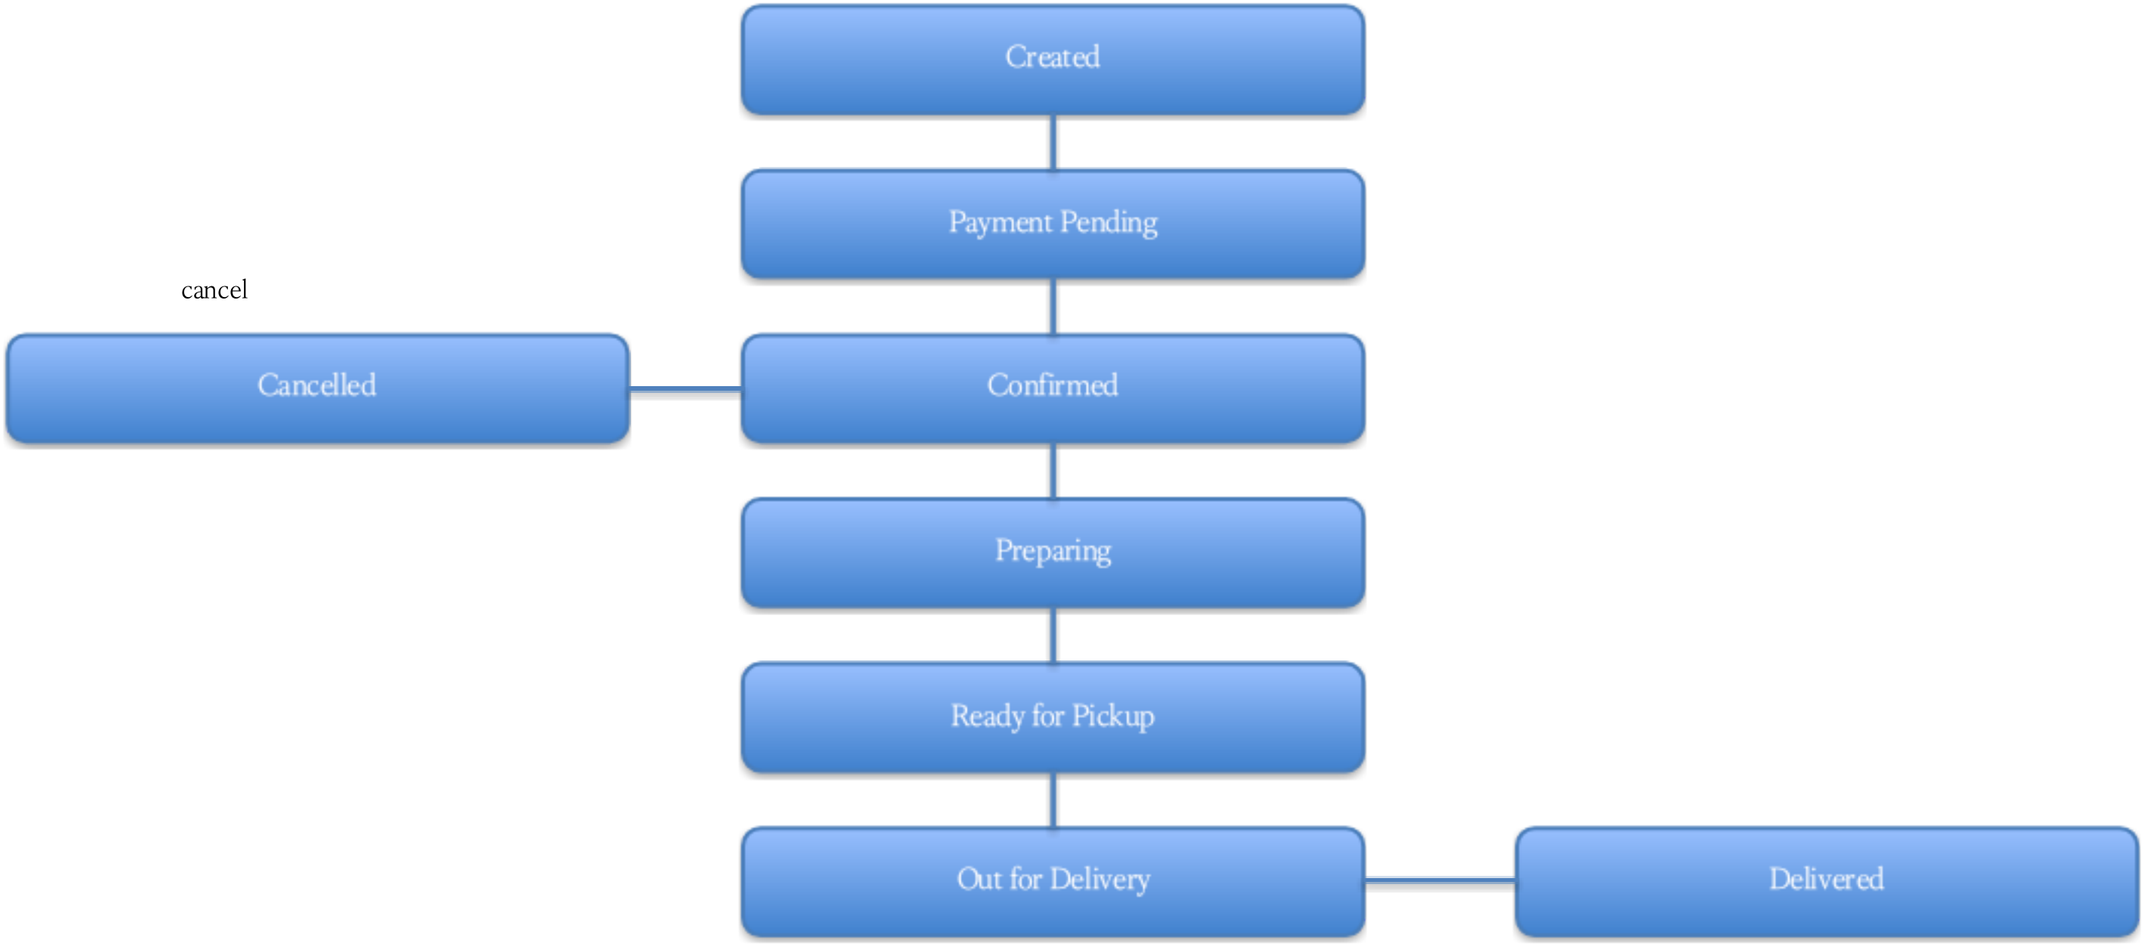

7. UML – Activity Diagram

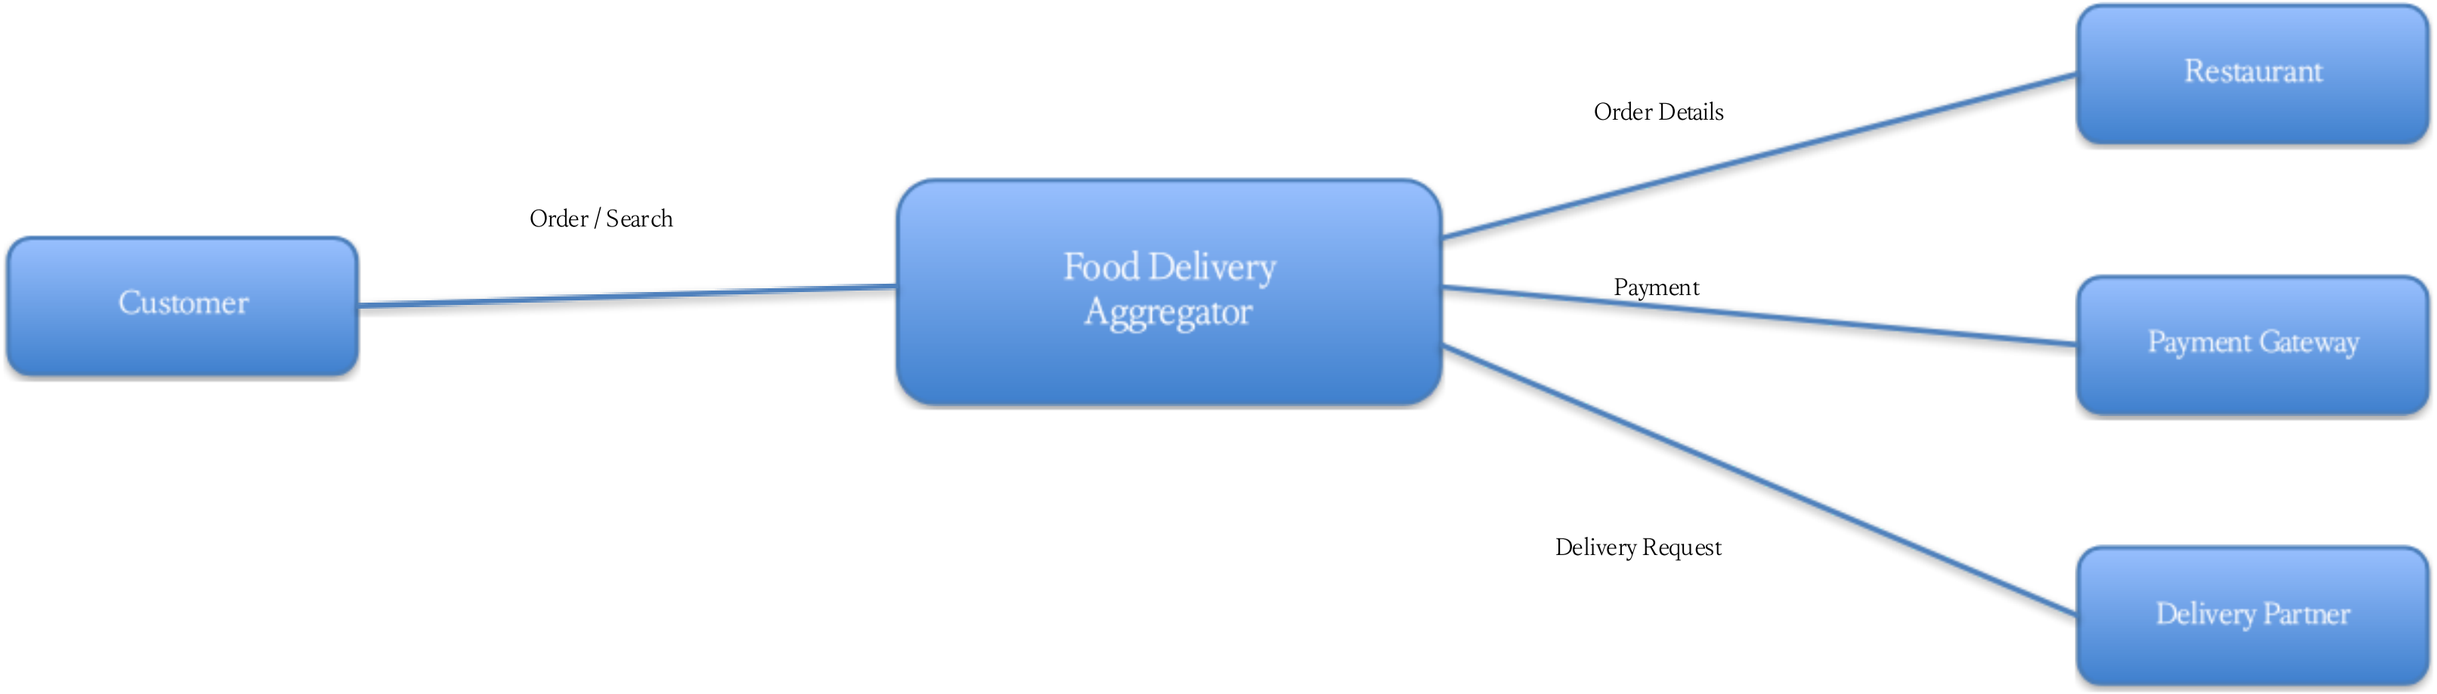

8. UML – Interaction (Sequence) Diagram

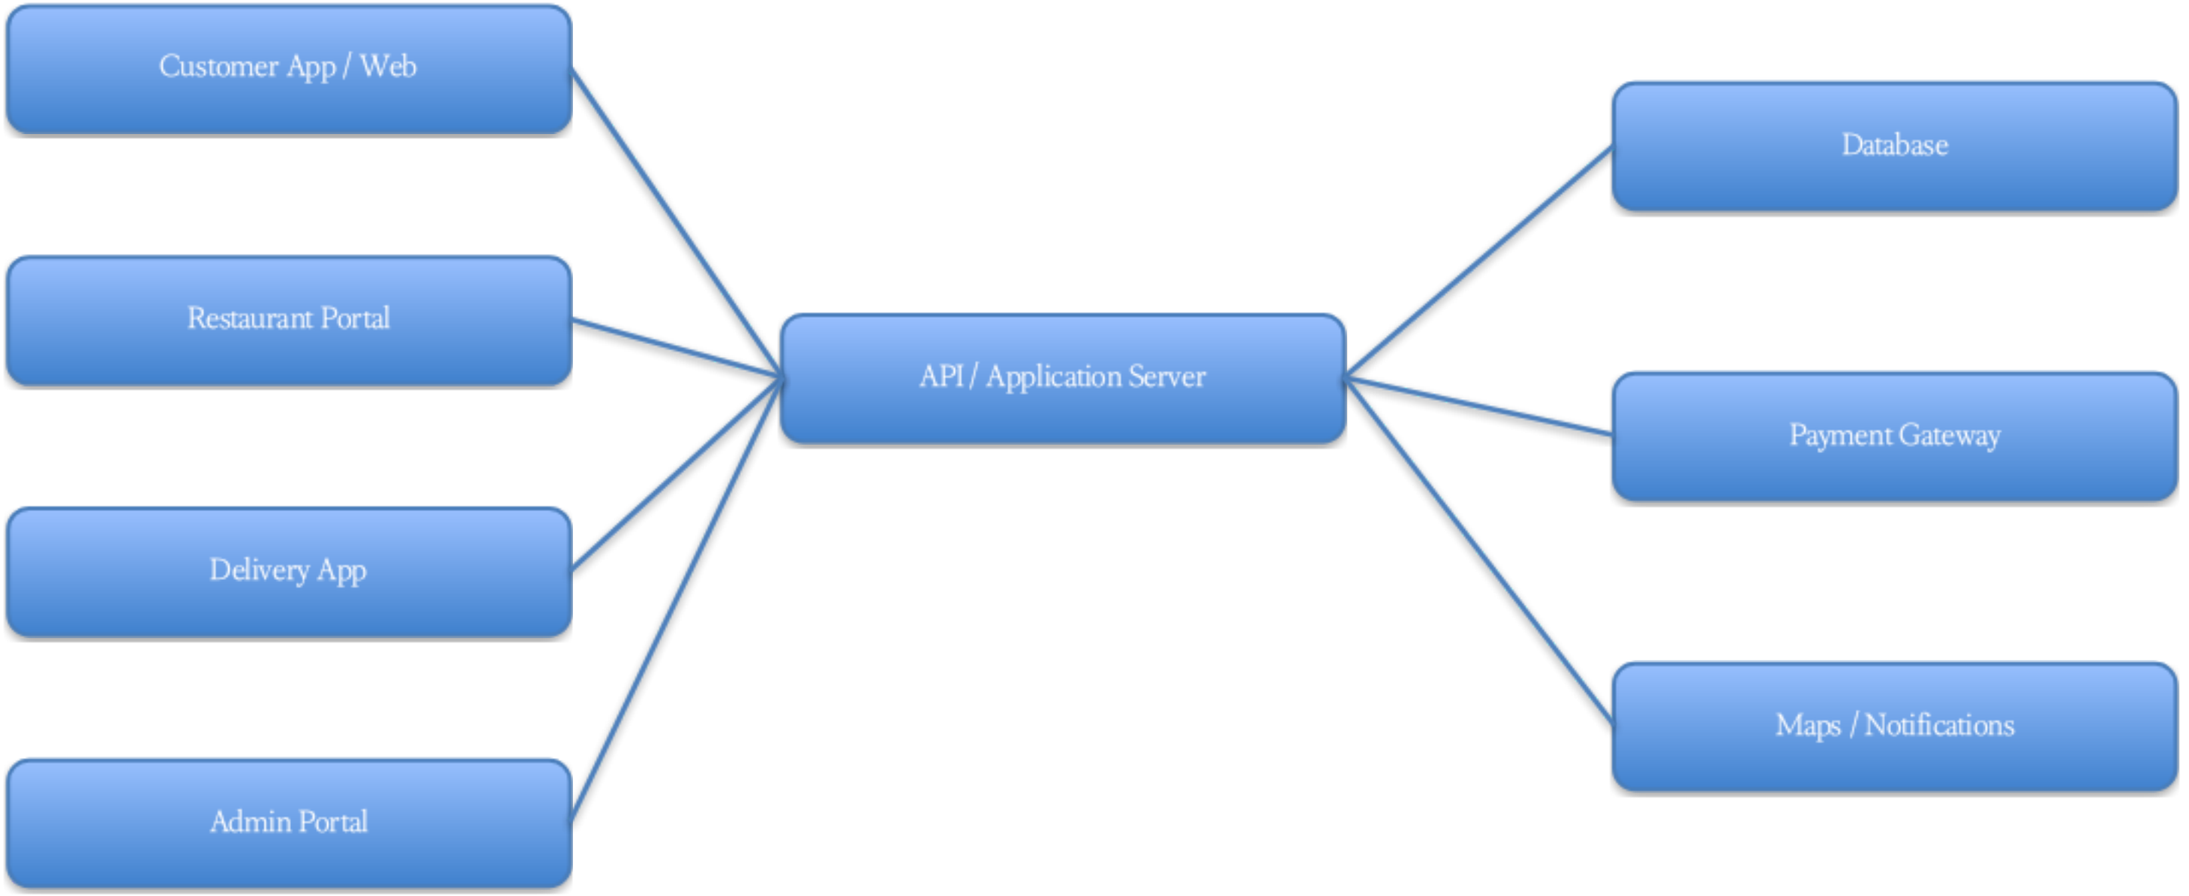

9. UML – State Chart (Order)

10. Data Flow Diagram (DFD)

11. System Architecture

12. Conclusion

The Food Delivery Aggregator provides a centralized platform for ordering and delivery coordination.

The SRS clearly defines system requirements, users, functions and quality attributes.

The UML diagrams represent structure, workflow, interaction, states and data flow.

The design can be extended with offers, subscriptions, AI recommendations and advanced analytics.
